

Subject: Carrier Sales Automation Prototype Update

To: c.becker@happyrobot.ai

Cc: recruiter@happyrobot.ai

Hi Carlos,

Ahead of our meeting, I wanted to share the latest progress on the inbound carrier sales automation prototype.

Current status:

- Built and deployed a FastAPI backend to AWS ECS/Fargate with HTTPS enabled at `https://api.hrsubs.dev``
- Implemented inbound carrier vetting through the FMCSA-backed carrier lookup flow
- Implemented load retrieval through a broker-controlled load API backed by a structured load dataset
- Added a completed-call webhook that stores call outcomes and negotiation metadata in PostgreSQL
- Built a live dashboard for custom metrics, including booking rate, negotiation activity, rate outcomes, lane mix, and recent calls
- Added deployment documentation and a reproducible AWS deployment path

The current workflow supports the core inbound use case:

1. Carrier provides MC number.
2. System verifies carrier details.
3. System retrieves the requested load.
4. Agent negotiates pricing.
5. Final call outcome is written into the metrics backend and surfaced in the dashboard.

Live assets:

- Dashboard: `https://api.hrsubs.dev/dashboard/``

For the meeting, I can walk through the workflow setup, show the live demo, and explain the deployment and reporting architecture.

Best,

Shanay Wadhwani
